

Photovoltaic panel back sheet peeling process

What is a PV back sheet?

The PV back sheet much stiffer than the encapsulant, serves as an integral component to protect the backside of the PV module. This component has an average thickness of around 0.3 mm . Constituted as composite structures and are manufactured using different layers of materials that include polymers, and adhesives.

What is PV panel recycling process?

The initial step in these PV panel recycling processes involves the removal of organic components to free standard and valuable materials. Thermal treatment is the main method employed for this specific purpose. Wang et al., involves a two-stage heating process.

Can photovoltaic panels be recycled?

Wahman and Surowiak introduced a selective mechanical peeling process for recycling photovoltaic (PV) panels in 2023. The process they proposed yielded back sheets with a purity of 96.5 %.

Which temperature is best for separating back sheet from photovoltaic modules?

Discussion In the hot knife technique experiments for separating the back sheet from photovoltaic modules, the most effective results were obtained at 200 °C. This temperature achieved an optimal recovery rate and the highest purity of 99.42 %, representing the best balance between efficiency and material integrity.

The findings reveal that the proposed hot knife technique effectively separate the back sheet layers from c-Si PV panels without breaking their integrity. The recovered back sheet can ...

The proposed method includes a selective mechanical peeling process supplemented by thermal treatment as the first step to separate the multilayer components of silicon-based PV panels.

In this study, we investigate the relationship between the peeling behavior of the backsheet of a photovoltaic (PV) module and its surface temperature in order facilitate removal of the backsheet ...

A severe process flaw can cause delamination within months of production (an „infant mortality" failure). In contrast, a marginal material incompatibility might only manifest after 5-10 years of environmental ...

PDF | This research article investigates the recycling of end-of-life solar photovoltaic (PV) panels by analyzing various mechanical methods, including... | Find, read and cite all the research ...

Instead of solely using the traditional thermal treatment, which can release toxic gases from polymer back sheets, this study proposes an alternative approach. The proposed method ...

The primary challenge in recycling crystalline silicon (c-Si) photovoltaic (PV) modules is separating the polymeric fractions, including back sheets, from the module structure.

Photovoltaic panel back sheet peeling process

The primary challenge in recycling crystalline silicon (c-Si) photovoltaic (PV) modules is separating the polymeric fractions, including back sheets, from the module structure. Thermal ...

Here, a laser irradiation followed by mechanical peeling method was proposed to recycle the back EVA layer on the solar cell in the c-Si PV module. Specifically, after removing junction box, ...

Consider the sunscreen analogy: the PV backsheet is the "sunscreen" for a module - its quality therefore determines the module's ability to fight against UV and exposure.
