

What is a smart grid?

Despite extensive study on renewable energy, no specific definition of smart grid has been established. The Electric Power Research Institute defines smart grid as the addition of a unified communications and control system to existing power distribution infrastructure in order to give correct information .

What is a microgrid?

The term "microgrid" refers to the concept of a small number of DERs connected to a single power subsystem. DERs include both renewable and /or conventional resources . The electric grid is no longer a one-way system from the 20th-century . A constellation of distributed energy technologies is paving the way for MGs,,.

Why do we need a smart grid?

A smart grid is required for improved energy control,the integration of renewable energy sources,and the response to surges in energy demand . Renewable energy sources (RES) are more sustainable,reliable,and cost effective than non-renewable energy sources (NRES).
